PROPERTY UNDERWRITING RISK SURVEY

It is an integral tool to ensure that risks are correctly identified, understood, assessed, and managed. Risk surveys provide factual and valued information and technical opinion, which enable Underwriters to identify key features of risks and recognize more favorable risks which allows Underwriters to offer the best possible terms and premiums to acquire or retain good quality insurance businesses.

Multipilar's risk engineers are well experienced complete with technical competence, which enable us to provide tailored solutions for our clients and their costumers; from small to medium enterprise (SME) through multinational organizations.

The risks are evaluated against exposures present in the discipline required, which include the following for property-based surveys :

- Management (safety management policy / organization / activities, labor-management relationship, maintenance/inspection program, permit-to-work system, etc)
- Construction (reinforced concrete, steel, timber, asbestos, masonry, building maintenance, etc)
- Occupancy (business process, production process including process hazard, hazardous materials, storage arrangement, etc)
- Protection (fire protection system, fire system inspection, and maintenance, water supply, emergency response team and procedure, etc.)
- Exposure (neighbors, natural hazards)

Multipilar's engineers will also provide Loss Estimates and risk improvement recommendations, which are essential to bringing the risk to an acceptable level.
